Although there have been other global pandemics since, the 1918 influenza pandemic stood out in that it lasted over a year, infected about a third of the world's population, and killed more than 50 million people. The deadly nature of H1N1 might be partly explained by bacterial superinfections. Data regarding bacterial superinfections in COVID-19 pneumonia are still emerging, but an association has been made between the detection of bacterial products in blood with disease severity in COVID-19 patients. 3Arunachalam PS Wimmers F Mok CKP et al. Systems biological assessment of immunity to mild versus severe COVID-19 infection in humans. Science. 2019 marked a century since the end of the 1918 H1N1 influenza A pandemic, and many marvelled at the fact that we had made it 100 years without a similar occurrence. There are numerous variations of solitaire that are usually played by one individual. Play continues with the remaining cards, and the goal of reaching 13 each time in order to continue. Talking about COVID-19 has become a ritual for everyone. However, defining what appropriate means remains problematic given the ongoing substantial challenges in diagnosing pneumonias. The lack of access to antibiotics kills more people than antibiotic resistance. 9Frost I Craig J Joshi J Faure K Laxminarayan R Access barriers to antibiotics. However, when faced with patients who are critically ill and hospitalised, and the diagnosis of a potential bacterial superinfection is uncertain, health-care providers will and should err on the side of treating with broad-spectrum antibiotics, both as directed and empirical therapy.
